Ex1: Social Network Ads

Cho dữ liệu Social_Network_Ads.csv

Sử dụng thuật toán KNN để dự đoán khách hàng mua (1) hay không mua sản phẩm (0) dựa trên các thông tin được cung cấp:

1. Đọc dữ liệu và gán cho biến data. Tiền xử lý dữ liệu (nếu cần)
2. Tạo inputs data với các cột trừ cột *Purchased*, và outputs data với 1 cột là *Purchased*
3. Từ inputs data và outputs data => Tạo X_train, X_test, y_train, y_test với tỷ lệ 70-30
4. Thực hiện KNN với X_train, y_train
5. Dự đoán y từ X_test => so sánh với y_test
6. Đánh giá mô hình => Nhận xét
7. Ghi mô hình (nếu mô hình tốt sau khi đánh giá)

   macro avg       0.87      0.88      0.87       120
weighted avg       0.88      0.88      0.88       120
```

Quan sát kết quả và đánh giá:

- Có sự chênh lệch giữa train r_score và test r_score ~7% => có thể tạm chấp nhận
- Mô hình có độ chính xác khá cao: 87.5%

Feature Selection
